and more ...

“The various religions are like different roads converging on the same point.

What difference does it make if we follow different routes, provided we arrive at the same destination?”

Mahatma Gandhi

A handwritten signature in black ink, reading "MK Gandhi". The signature is written in a cursive, flowing style with a large, prominent "G" and a small dot at the end.

GO FROM vertex 2 TO vertex 3

THE QUERY

```
SELECT * FROM pgr_dijkstra(  
    SELECT id,  
           source,  
           target,  
           cost,  
           reverse_cost,  
    FROM edge_table',  
    2, 3);
```

THE RESULT

seq	path_seq	node	edge	cost	agg_cost
1	1	2	4	1	0
2	2	5	8	1	1
3	3	6	9	1	2
4	4	9	16	1	3
5	5	4	3	1	4
6	6	3	-1	0	5

CONTRACTION

CONTRACTION

- Graph Contraction, when working on big graphs:
 - road graphs,
 - electric networks
- Speeds up some graph algorithms.
- The current implementation:
 - Flexible Framework
 - “Easy” to add a new operation.
 - Dead end contraction
 - Linear contraction

THE CONTRACTION SKELETON

- An initial set up that may involve analyzing the graph given as input and setting the non contractible nodes or edges.
- A cycle that will go and perform a contraction operation until/while possible, and then move to the next contraction operation.
- Adding a new operation then becomes an “easy” task:
 - Add new contraction operation class.
 - Add some interaction between contractions.
- Currently, there are two implemented operation for contracting a graph
 - Dead End contraction
 - Linear contraction

DEAD END

Undirected Graph

- The number of adjacent vertices is one.

Directed Graph

- Case 1
 - No outgoing edges
 - At least one incoming edge.
- Case 2
 - One incoming edge
 - One outgoing edge
 - Same identifier on the edges.

LINEAR

Linear Node

- Two adjacent vertices.
- At least one incoming edge and one outgoing edge.

Linear Contraction

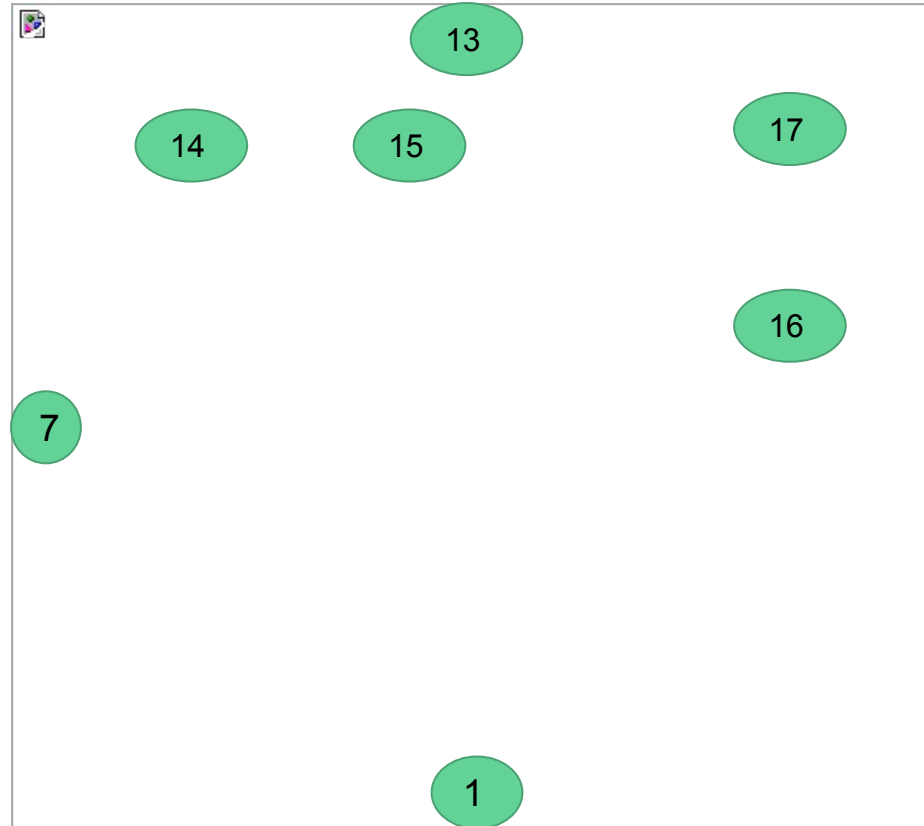

EXAMPLE

THE REPRESENTED ROADS

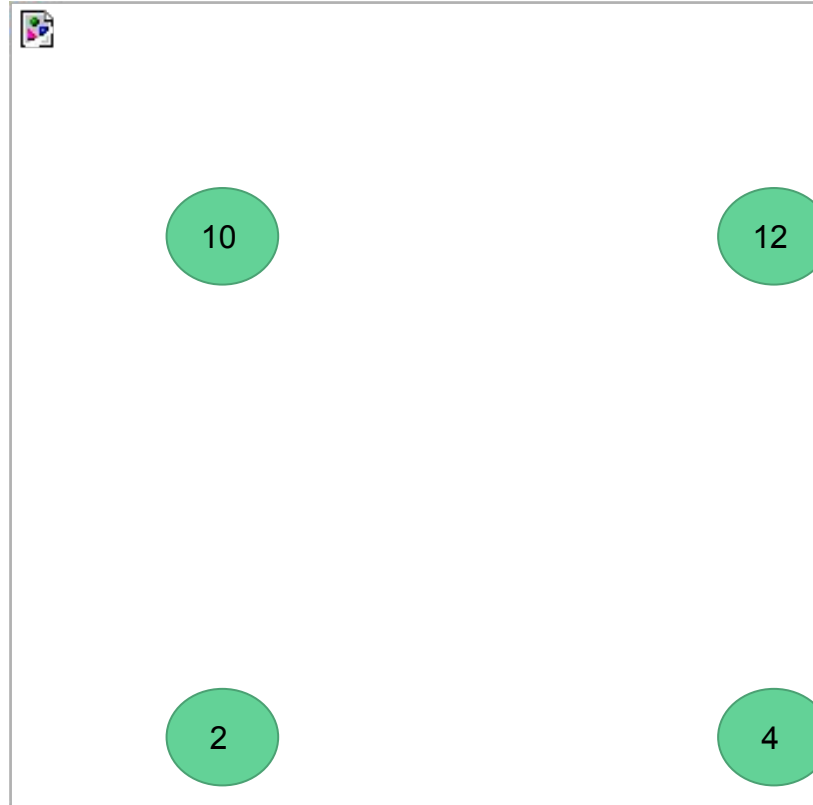

DEAD END

AFTER CONTRACTION

LINEAR

AFTER CONTRACTION

THE QUERY

```
SELECT *  
FROM pgr_contractGraph(  
    'SELECT id,  
        source,  
        target,  
        cost,  
        reverse_cost  
FROM edge_table',  
    ARRAY[1, 2]);
```

THE RESULTS

seq	type	id	contracted_vertices	source	target	cost
1	v	2	{1}	-1	-1	-1
2	v	5	{7,8}	-1	-1	-1
3	v	15	{14}	-1	-1	-1
4	v	17	{16}	-1	-1	-1
5	e	-1	{4}	9	3	2
6	e	-2	{10,13}	5	11	2
7	e	-3	{12}	11	9	2

2016 GSoC Student
Thank you Andrea!

FLOW

Maximum FLOW

Maximum flow algorithms route the maximum amount of one commodity from one source S to one sink T .

This functionality was added to the library, in addition to some example applications:

- Edge disjoint paths
- Multiple source/sink flow
- Maximum cardinality matching

Maximum FLOW

Maximum FLOW

```
CREATE TABLE flow_example (  
    id SERIAL,  
    source INTEGER,  
    target INTEGER,  
    capacity INTEGER  
);
```

```
INSERT INTO flow_example (source, target, capacity) VALUES  
(1, 2, 10),  
(1, 3, 10);  
(2, 3, 2),  
(2, 4, 4);  
(2, 5, 8);  
(3, 5, 9);  
(4, 6, 10);  
(5, 4, 6);  
(5, 6, 10);
```

THE QUERY

```
SELECT * FROM pgr_maxFlowEdmondsKarp (  
    'SELECT id,  
        source,  
        target,  
        capacity  
    FROM flow_example',  
    1, 6  
);
```

THE RESULTS

seq	edge_id	source	target	flow	residual_capacity
1	1	1	2	10	0
2	2	1	3	9	1
3	4	2	4	4	0
4	5	2	5	6	2
5	6	3	5	9	0
6	7	4	6	9	1
7	8	5	4	5	1
8	9	5	6	10	0
